QDR·AI

PLANT ENGINEERING · SUPPLIER DOCUMENT INSPECTION & REVIEW

User Guide

How to inspect a supplier submittal, step by step

What this guide covers

1 Open the application
2 Load the Review Guide
3 Load the supplier document
4 Start the inspection
5 Wait for the completion signal
6 Read the results
7 Check the findings
8 Download the results

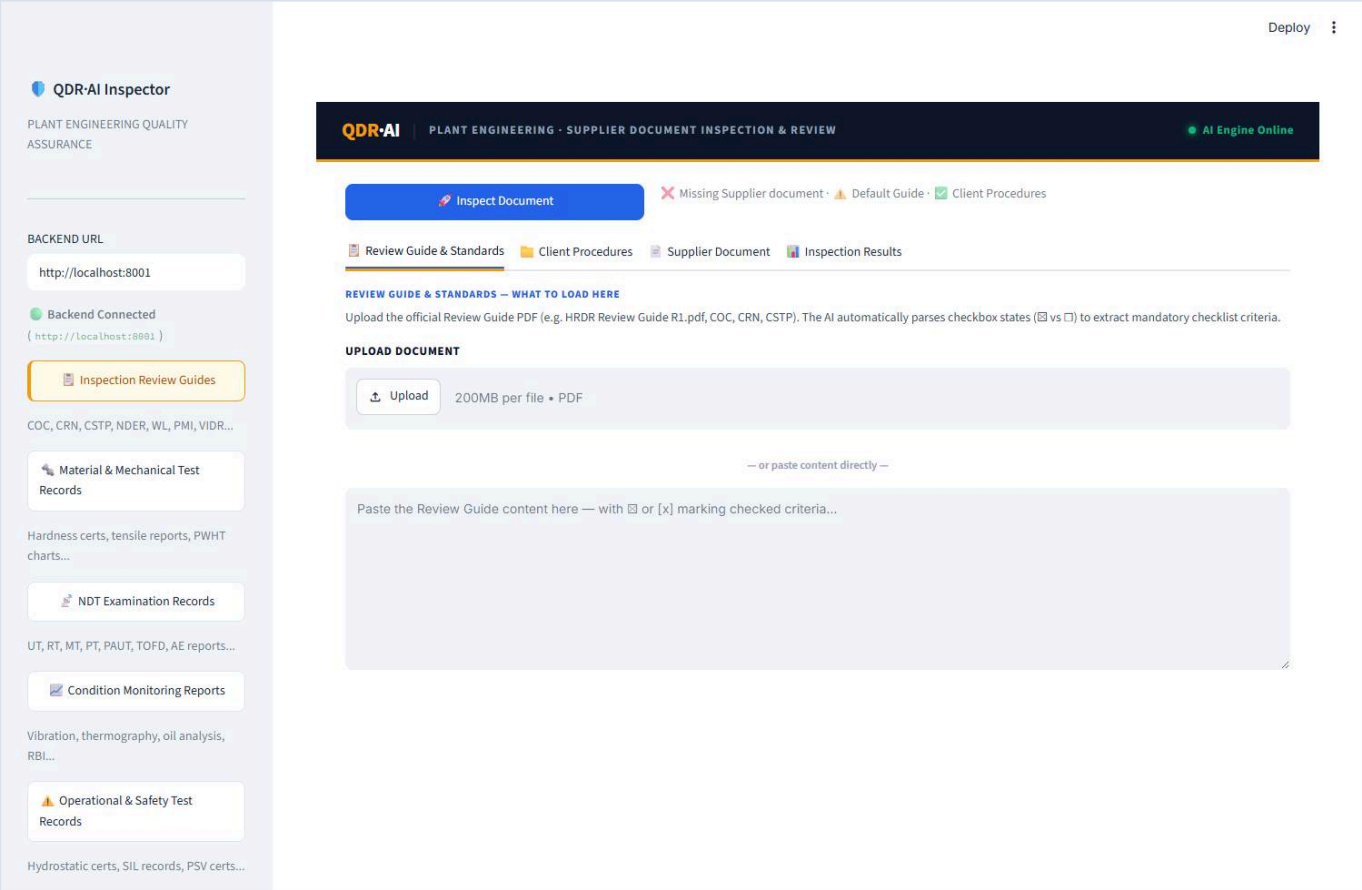

Every screen in this guide is a capture of the running application, taken while inspecting a real submittal. Screens on your machine will match, apart from the document names and the findings themselves.

Step 1

Open the application

Open QDR·AI in your browser. The controls sit in the left sidebar; the work area on the right is organised into four tabs.

Check the sidebar reads Backend Connected before you start. The status chips beside the Inspect Document button show what is still missing · at this point · Missing Supplier document is expected.

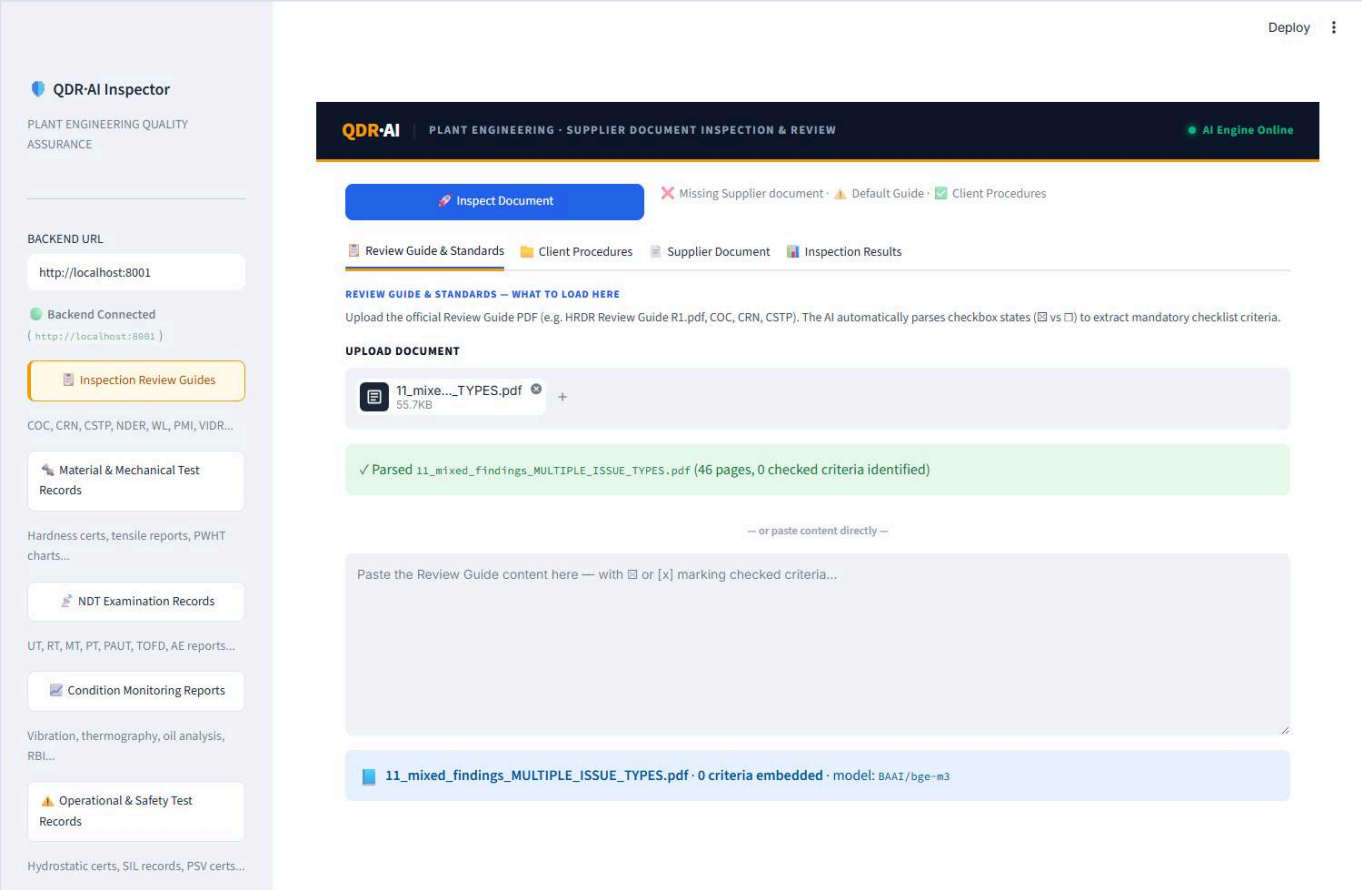

· The four tabs are worked left to right: Review Guide, Client Procedures, Supplier Document, Inspection Results.

Step 2

Load the Review Guide

Open the Review Guide & Standards tab and use Upload to select the guide PDF (for example HRDR Review Guide R1.pdf).

The application reads the checkbox states in the guide and extracts the mandatory criteria automatically. A green confirmation appears showing the page count and how many checked criteria were identified.

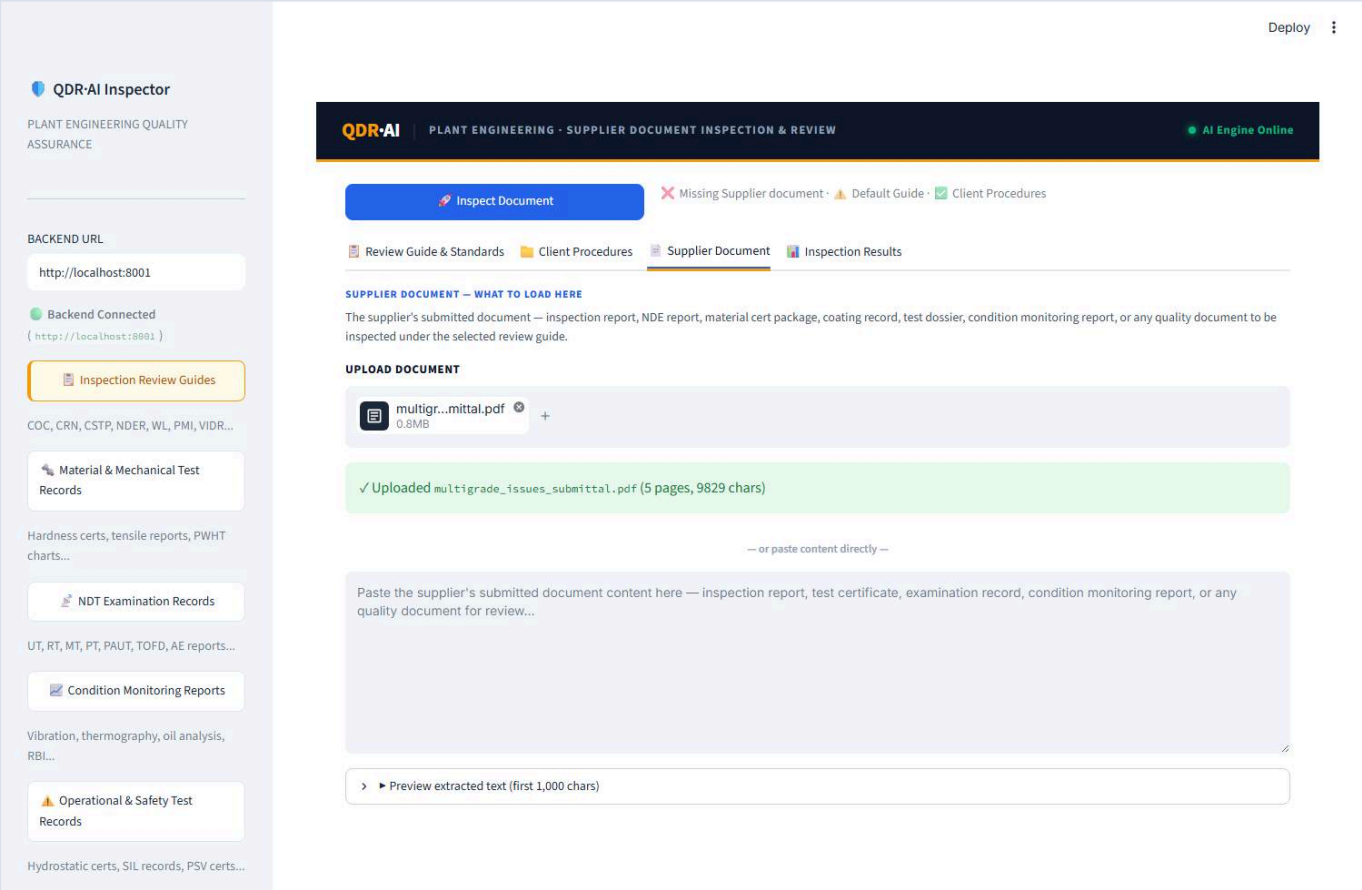

· No guide of your own? A default guide is already loaded, shown by the · Default Guide chip.
· You can paste guide text directly instead of uploading a file.

Step 3

Load the supplier document

Open the Supplier Document tab and upload the document to be reviewed · a hardness report, NDE report, material certificate package, or similar.

A green line confirms the upload with the page and character count, for example: Uploaded multigrade_issues_submittal.pdf (5 pages, 9829 chars).

· Use Preview extracted text to confirm the document was read before running.
· Wait for the green confirmation. Large scanned files take a few seconds.

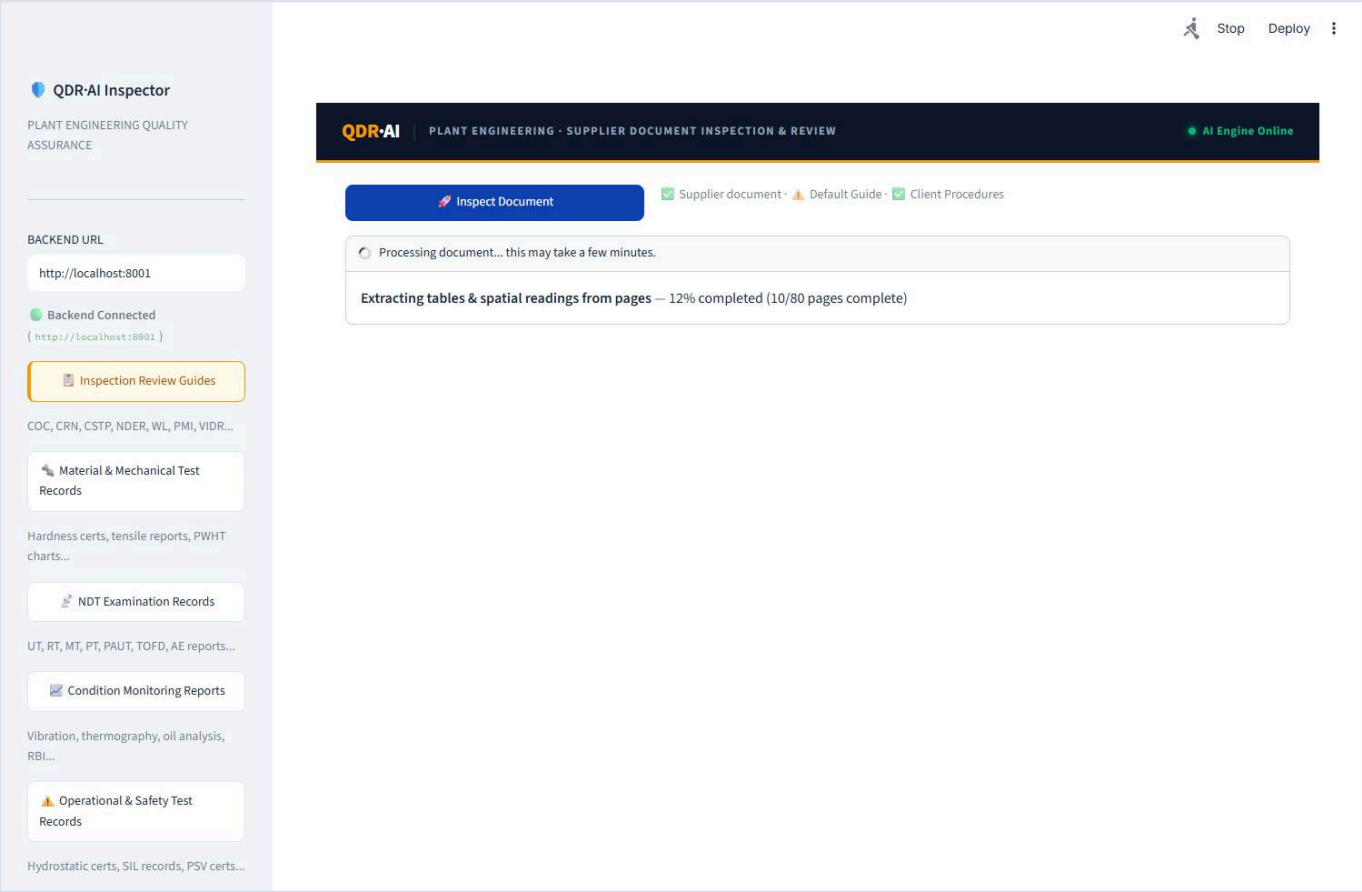

Step 4

Start the inspection

Click the blue Inspect Document button at the top of the work area.

A status panel opens and reports progress live · the current stage and a percentage, and for page scanning the number of pages completed.

Leave the tab open while it runs. Typical documents finish in under two minutes; an 80-page scanned submittal takes roughly a minute.

· Only one inspection runs at a time. If another is in progress you will be asked to wait rather than starting a second.

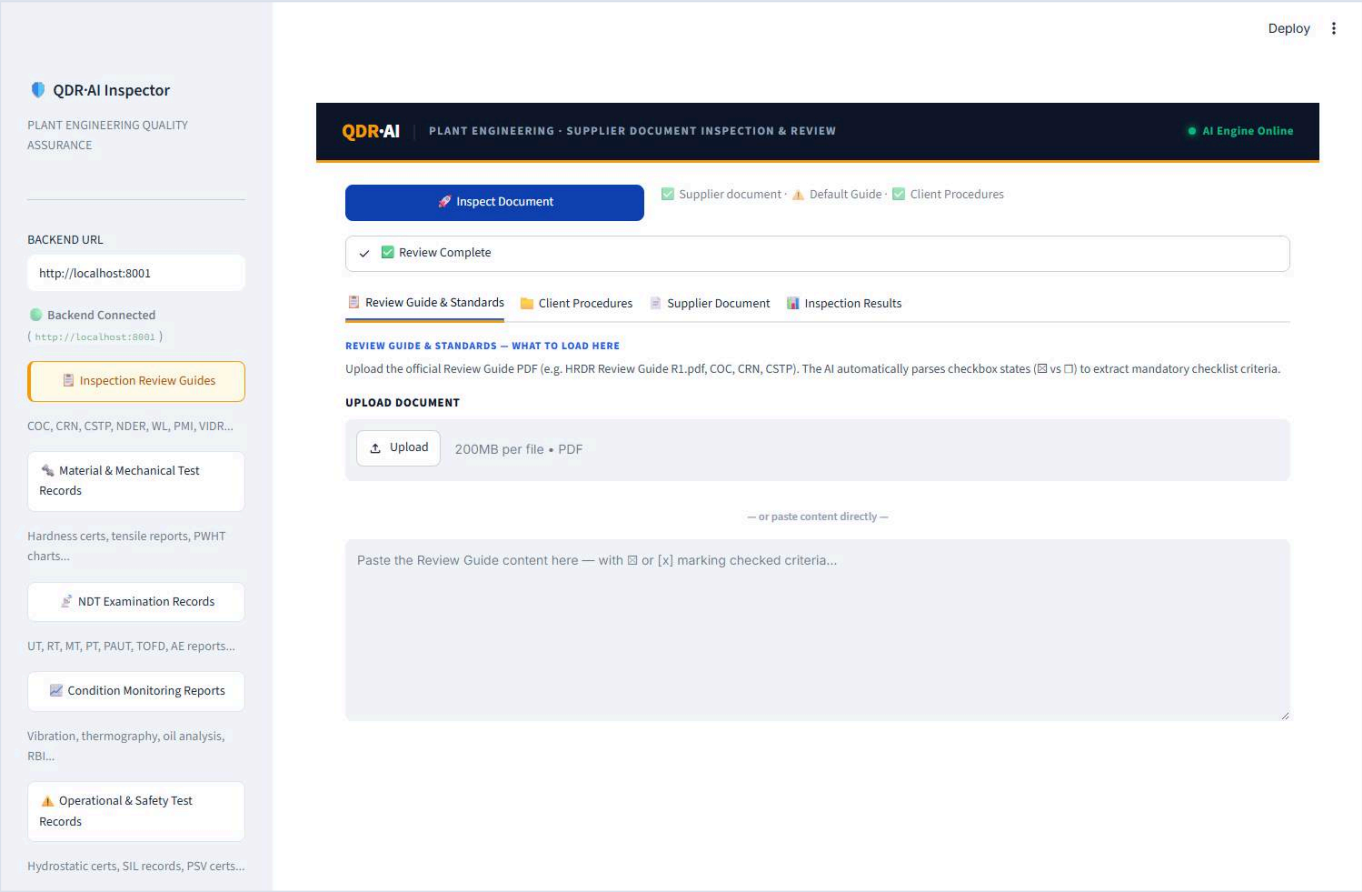

Step 5

Wait for the completion signal

When the run finishes, the status panel changes to a green · Review Complete banner. That is the signal that the report is ready.

The chips beside the button also update to · Supplier document, confirming the run used the document you loaded.

If something goes wrong the banner turns red instead · · Inspection Failed · and names the stage that could not complete. No partial report is written in that case.

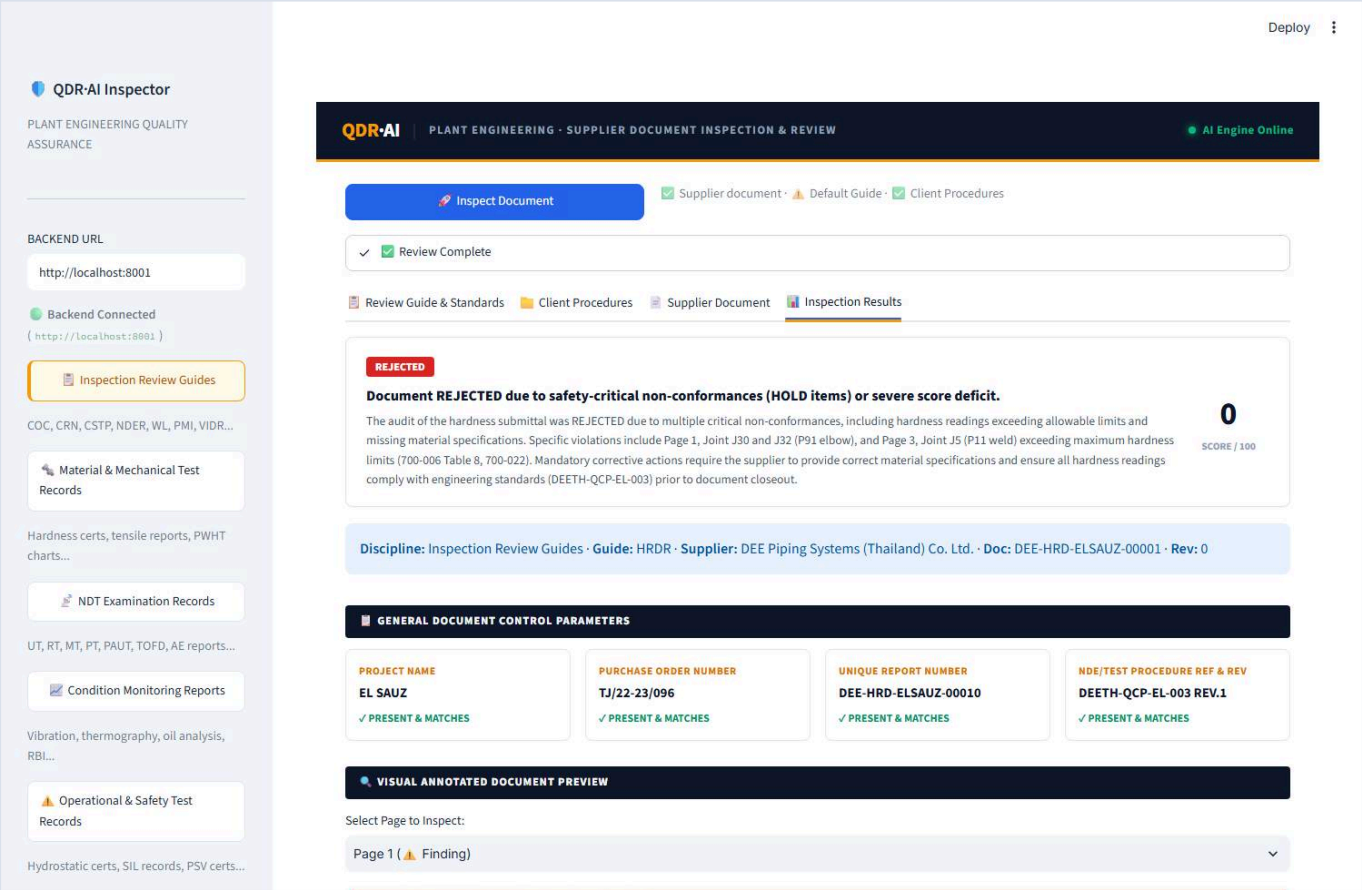

> · The banner is the notification: there is no email or pop-up. Keep the tab open, or revisit it · results stay in the session.

Step 6

Read the results

Open the Inspection Results tab. The top card gives the disposition (REJECTED, REVISE or APPROVED), a score out of 100, and a written summary of why.

Below that, General Document Control Parameters shows whether the project name, PO number, report number and procedure reference were present and matched.

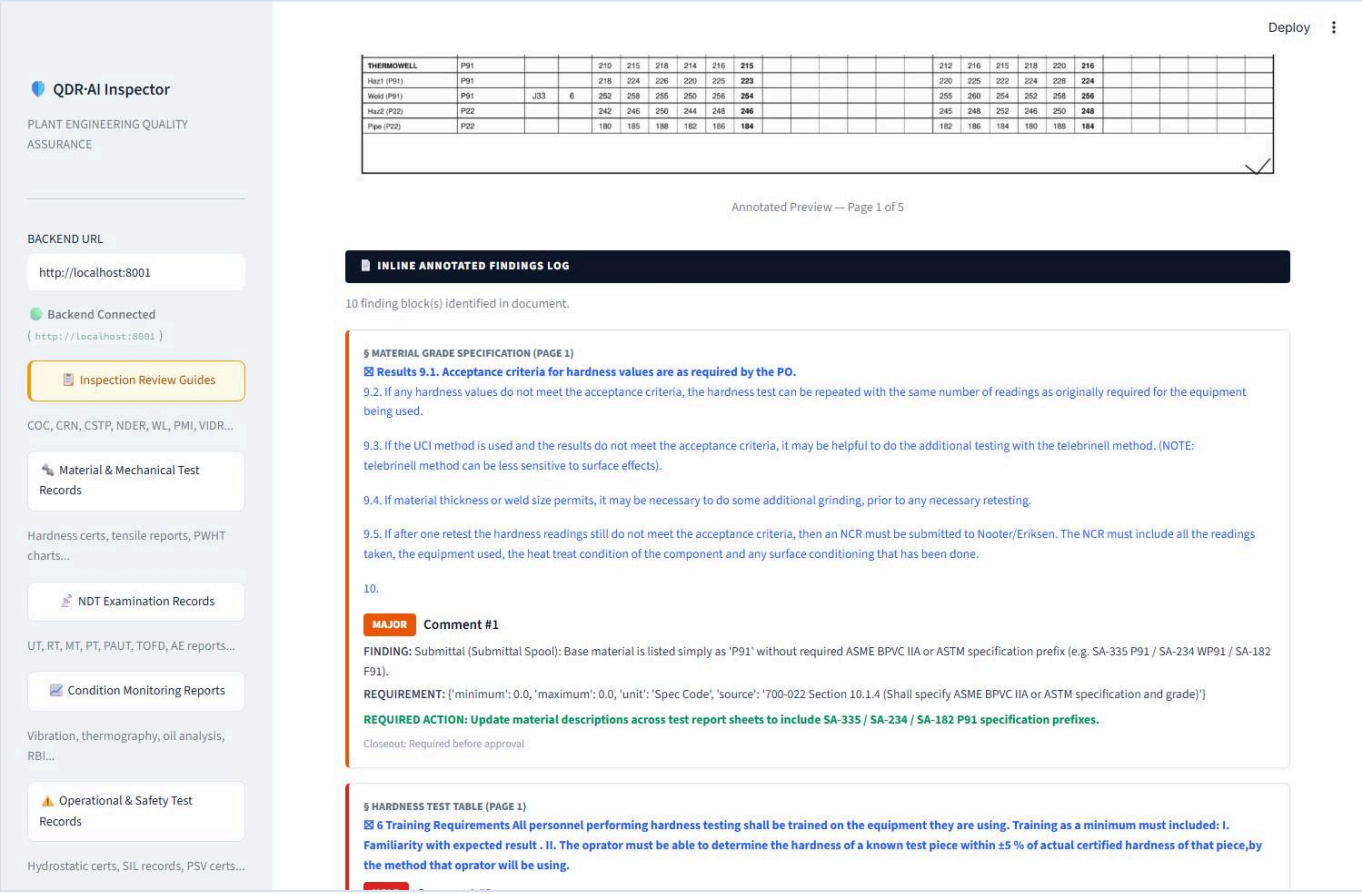

> · A document is never APPROVED while any material was left unevaluated · the report says so explicitly rather than implying a pass.

Step 7

Check the findings

Scroll to the Visual Annotated Document Preview to see each page with the failing readings boxed, and use the page selector to move between pages that carry findings.

The Inline Annotated Findings Log lists every finding with its severity, the readings that failed, the requirement they breach and the specification clause cited, plus the corrective action required.

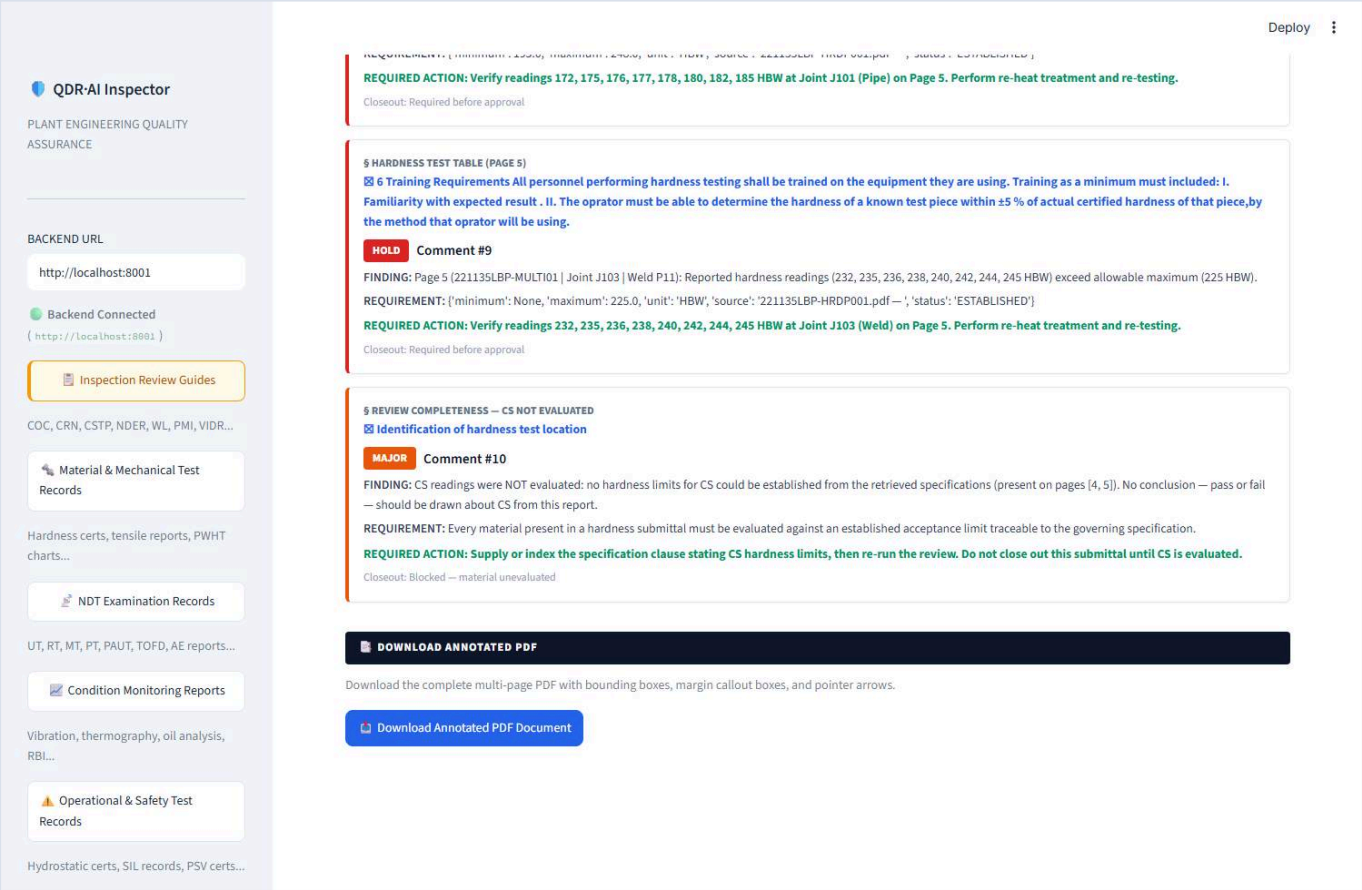

· Each finding cites the clause its verdict rests on, so it can be checked against the specification without rerunning anything.

Step 8

Download the results

At the bottom of the Inspection Results tab, use Download Annotated PDF Document to save the submittal with every finding marked on the page.

The annotated copy is prepared automatically as soon as the run completes, so the download is immediate. If it was not generated, a Generate Annotated PDF button appears instead · click it once and the download button replaces it.

· The annotated PDF is the copy to send back to the supplier: findings are boxed on the page they occur, numbered to match the findings log.
